

BAClet

Versatile and mobile consumption tracker

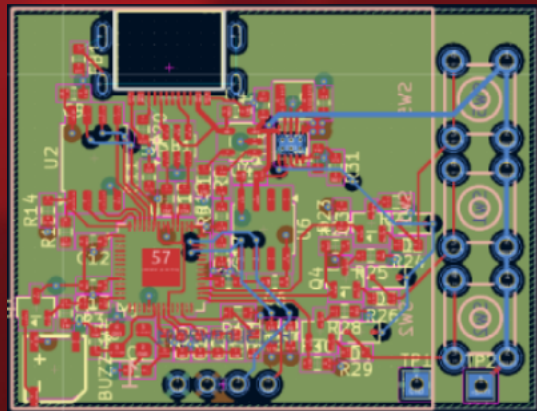

Eliminate the guesswork from
"How ____ am I?"

A mobile, battery powered trinket that measures BAC (Blood Alcohol Content) by tracking time and drinks you enter via the extraordinarily user friendly triple button system.

```
DateTime now = rtc.now();  
float totalBAC = 0.0;  
  
for (int i = 0; i < drinkCount; i++) {  
    float hoursPassed = (now - drinkTimes[i]).total  
  
    float bac = (DRINK_GRAMS_ALC / (BODY_WEIGHT_KG  
    bac -= METABOLISM_PER_HOUR * hoursPassed;  
  
    if (bac > 0) totalBAC += bac;
```

Obviously this is not a medical device. You input body params on setup, then can log each drink by volume and percentage, and it calculates BAC. It has charging, a buzzer, USB serial, and a nice 1.28 OLED, all behind an auto-off switch to save power.
